BACKGROUND

> **Title:** Strong Interactions and New Physics at the LHC

> **Background and aim:**

- Strong interaction least well understood building block of Standard Model.
- Still good progress recently by experimental (HERA) and theoretical efforts.
- In-depth understanding of strong force particularly important for search and interpretation of new physics at the LHC.
 - understand better the strong force and implement knowledge in LHC data analysis and interpretation
- Fruitful collaboration of experimentalists and theorists expected.

> **People involved in the project section:**

- Project leaders J. Bartels (theory) and R. Klanner (experiment)
- Theory: L. Motyka (PostDoc), F. Schwennsen (PhD)
- Experiment: J. Sztuk (PostDoc), TSS (PostDoc), T. Theedt (PhD), A. Bonato (PhD), several diploma students
- Expecting input and contributions from other interested theorists and experimentalists from DESY, CERN, ...

WORK PLAN

- (i) Precision measurement of the parton distributions in the proton including a reliable estimation of its uncertainties.
- (ii) ~~Experimental and theoretical studies of the QCD radiation in the domain of high parton densities at low parton momenta.~~
- (iii) Understanding of final states with large rapidity gaps.
- (iv) Study of the impact of multiple (secondary) interactions and of underlying events.
- (v) ~~Study of jet algorithms at high transverse energies optimizing the information from the tracking detectors and the calorimeter.~~

PRECISION MEASUREMENTS OF PDFs

> HERA: PDFs (with uncertainties) typically from structure function F_2 :

- Large uncertainties at high gluon- $x > 0.1$;
correlation between α_S and gluon.

$$\frac{\partial F_2(x, Q^2)}{\partial \ln Q^2} \approx \alpha_S(Q^2) g(x, Q^2)$$

> Use of jet events (DIS and γp)

- would allow decoupling of α_S and gluon;
- allows access to different x ranges;
- allows direct access to gluon density.

> Last ZEUS NLO QCD fit (DESY-05-050) reduced gluon errors significantly.

- see next slide.

> Next steps: Input more final states data:

- Charm and beauty data (heavy flavour structure functions F_2^{cc} , F_2^{bb} , directly sensitive to gluon density),
- more and multidifferential jet data,
- charged current data with polarized e^\pm beam (also full HERA-II statistics for NC),
- F_L at HERA, W, Z at LHC (next slide)

PRECISION MEASUREMENTS OF PDFs

- > ZEUS NLO QCD Fit with(out) jets:
 - fractional gluon uncertainty

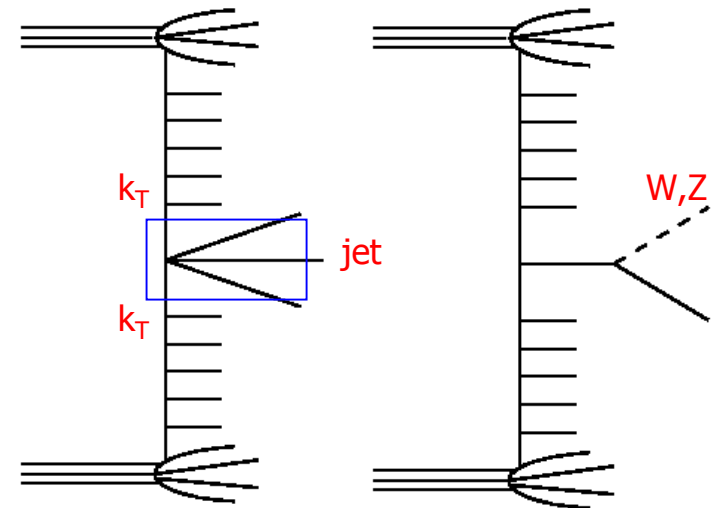

- > F_L at HERA
 - longitudinal structure function directly sensitive to QCD effects
 - F_L measurement will be performed at end of HERA running in 2007.
- > W, Z at the LHC
 - Cross-sections for W, Z production are among the most precise measurements at the LHC.
 - Also theo. predictions quite precise, and sensitive to proton PDFs.
 - Using cross-section ratios might help reduce uncertainties.

PRECISION MEASUREMENTS OF PDFs

- > "Forward jets" and parton dynamics in the proton
 - Deviation from collinear factorisation observed in HERA data; but theoretical situation unsatisfactory: BFKL, resolved photons, higher orders, ...?
 - New theory approach based on NLO BFKL evolution; theorists working on combination of ingredients (cast everything into Monte Carlo?)
 - Preparing more studies in HERA-II data.

- > NLO k_T factorisation at the LHC
 - regions at HERA where k_T factorisation seems advantageous.
 - at LHC jets at smallish k_T and x test case.
 - Also W, Z production interesting (will be needed for detector calibration)
 - Currently being worked on (F. Schwennsen).

LARGE RAPIDITY GAPS

> Hot issue: LHC double-diffractive Higgs production:

- Tagging of protons would allow precise Higgs mass determination (MeV!).
- Durham: Eikonal model for treatment of soft rescattering.
- But dynamics not accurately modelled?
- try more complete "hard rescattering"
- better estimate of (small) Higgs Xsection?

> Evidence: large factor between HERA and TEVATRON diffractive dijets:

- Factor 5-10 needed to bring data to agreement.
- Shape of distributions in agreement?

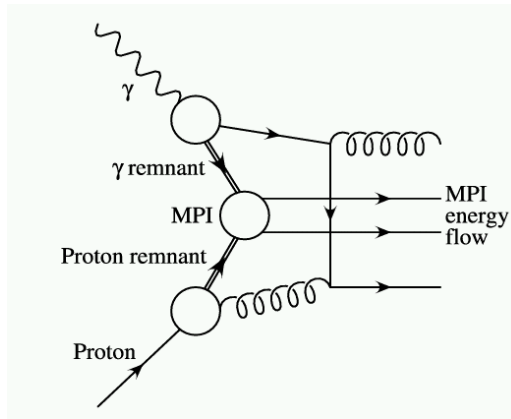

> Possible approach:

- study dPDFs at HERA and LHC
- using for example dijets
- H1 has published dPDFs.
- ZEUS measurement in publication process.

MULTIPLE INTERACTIONS AT HERA+LHC

- > Multiple interactions, the underlying event (UE)
 - will play major role in many analysis at the LHC
 - at HERA: jets in photoproduction, diffraction

- > Expected at the LHC (and partly tested at TEVATRON):
 - Underlying event in minimum-bias events
 - Effect on jets: partons from different interactions?
 - Effects on Drell-Yan events, etc.
 - Background to new physics (6 b jets events ...)

> Activities:

- Measurements of MPI and UE at ZEUS and CMS
- Theory: - Handling of parton-jet relation? Modelling?
- Deliver constraints to MC builders.

PROJECT SECTION PLANS (SUMMARY)

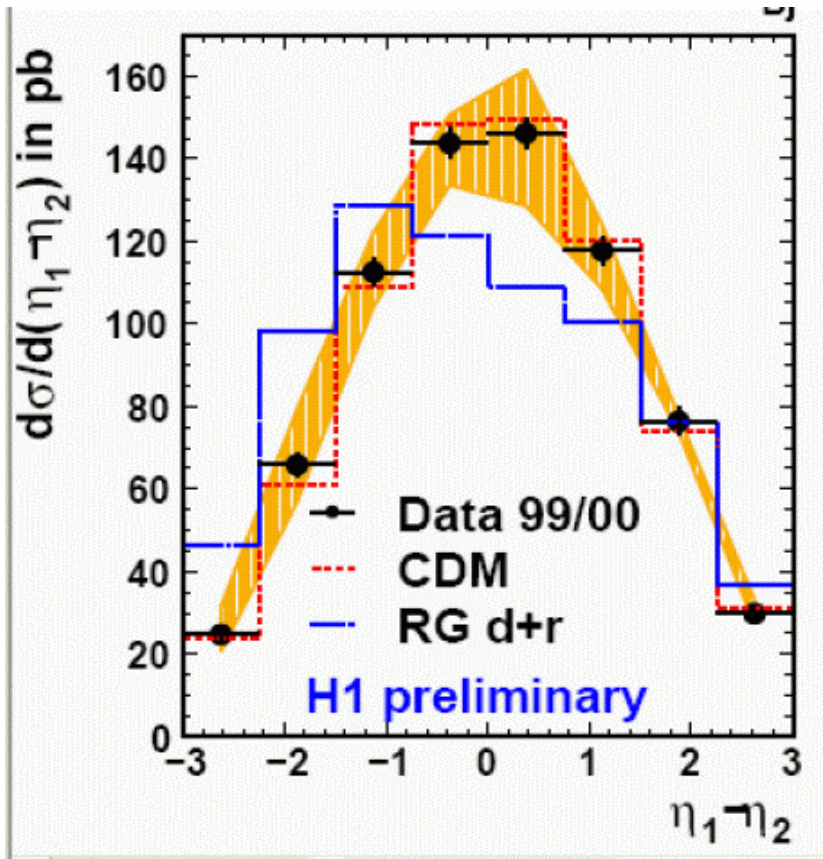

- > Precision measurements of PDFs, understanding of parton dynamics (i):
 - Large **progress in measurements** for x values up to 0.1.
 - Now using final states (**jets**, charm, F_L , CC, W,Z at LHC) to reduce errors.
 - **forward jets at HERA**: deviations from coll. factorisation? BFKL? MC at NLO?
 - **k_T factorisation in NLO at LHC**: jets? W,Z \rightarrow detector calibration?
- > Large Rapidity Gaps (LRG) (iii):
 - Eikonal model for double-diffractive Higgs production at LHC receives large attention; alternative **approach based on hard rescattering** by project members.
 - Evidence for necessity: Factor 5-10 between HERA and Tevatron diffractive dijets!
 - Study **dPDFs at HERA** and LHC with different approaches.
- > Multiple Interactions and the “Underlying Event” (iv):
 - Multiple interactions are an important issue for many physics processes at LHC.
 - Evidence at HERA: **Jets in γp** , diffractive final states.
 - Expected at the LHC: **underlying events, jets from multiple interactions, ...**
Question of modelling in MC programs.
